

# Improving Screening Mammogram Rates Among Low-income Hispanic Women in Primary Care Clinics

Tammy Walker-Smith\*, MHA, MSN, APRN, FNP, Sara Baldwin, Ph.D., PHNA-BC, RN, & Christina Murphey Ph.D., RNC-OB

#### **AIMS**

- Implement evidence-based mammogram clinic screening tool/ referral process.
- Examine mammogram (MG) rates among low-income women (50-74 years of age) in primary care clinics.

#### **BACKGROUND**

- ➤ A breast cancer disparity gap exists in this population (76% Hispanic). The 5-year survival rate is 79% Hispanic versus 92% Whites.
- ➤ There is an urgent need to establish: (a) change in the clinics' screening and referral process, (b) educate health providers on best practice tools, and (c) improve MG rates.

# **METHODS**

- > IRB determination of QI status obtained.
- ➤ EBP tools: Breast Cancer Risk Assessment Tool (BCRAT) and the National Health Interview Survey (NHIS). Pretested with Hispanic population.
- Clinic staff trained on EBP tools and screening procedure with participants x 3-months.

#### **RESULTS**

Table 1. Clinic Staff's Pre-and-post Training Survey

|  |          |    |       | Contract of the Contract of th |          |

Table 2. Mammogram Completion Rates

| ٩  | Timeline                                   | %          | % Improvement |  |
|----|--|------------|---------------|--|
|    |  | Mammogram  | with QI       |  |
|    |  | Completion | Interventions |  |
|    |  | Rate       |               |  |
|    | Initial Data 10/2017                       | 54.8%      |               |  |
| l. | Baseline: 2/2018                           | 58%        |               |  |
|    | 1 <sup>st</sup> month 3/2018               | 62.3%      | 4.3%          |  |
|    | 2 <sup>nd</sup> month 4/2018               | 63.5%      | 1.2%          |  |
|    | 3 <sup>rd</sup> month 5/2018               | 65.21%     | 1.7%          |  |
|    | Total 1 <sup>st</sup> -3 <sup>rd</sup> mo. |            | 7.21%         |  |

\*p <0.05 \*Paired t-test results between baseline and 3-mo

## **KEY FINDINGS**

- Interventions increased MG completion rates 7.21% in 3-months.
- Paired t-tests revealed staff's statistically significant knowledge improvement: t (17) = 4.37, p < 0.01, with Cohen's d= 1.21 and a medium effect size ( $\alpha$ = 0.52).
- > 55.5% of screenings generated referrals.

## **CONCLUSIONS**

- ➤ Short term clinical outcomes showed promise after the project completion.
- ➤ Local mammogram completion rate now 1.5% below the national average (66.7%).
- Interdisciplinary training and participation was integral in increasing MG rates

#### **RECOMMENDATIONS**

- Evidence applicable for practice collaboration across disciplines.
- ➤ Facility to continue EBP tools to generate nurse referrals for continued MG completion rates.
- Providers to consider standing screening mammogram orders based on EBP tools and outcomes.
